Dear Bending Spoons Team,

I want to work somewhere that measures itself against becoming one of the great companies of any era, not just a good one. Your approach to acquiring products and rebuilding them for the long term, rather than flipping them, is exactly the kind of ownership I want to be part of, and a culture with minimal hierarchy and small, talent dense teams is the environment I do my best work in.

My background is in production engineering rather than security specifically. At L3Harris I build CI/CD pipelines with static analysis and integration testing for defense sensor systems, and at Doxy.me I owned a production ML platform end to end, including its infrastructure, monitoring, and release process. I have not run offensive security assessments professionally, but the instinct this role asks for, finding the gap nobody has closed yet and closing it before it becomes a problem, is how I have approached every system I have owned so far.

Your process explicitly tells candidates not to self-reject over an imperfect CV, so I want to be direct about where I stand: I am applying because I believe the reasoning ability and ownership this role demands matter more than a security specific resume, and I am ready to prove that through your tests.

I would welcome the chance to show you how I think through a hard problem.

Sincerely,

Raj Reddy
