

Education

University of Utah

B.S. Computer Science

Salt Lake City, UT

August 2020 – May 2025

Relevant Coursework: Computer Systems, Machine Learning, Computer Graphics, Algorithms, Software Practice I & II, Database Systems, Computer Networks, Foundations of Data Analysis, Models of Computation, and Linear Algebra.

Skills

Languages: Python, TypeScript, C++, SQL, Java

Software: Pandas, NumPy, React, Node.js, AWS, Azure, Docker, Next.js, .NET, REST, Django, MongoDB, Linux

Experience

L3Harris Technologies

Associate Software Engineer

Dallas, TX

June 2025 – Present

- Reduced deployment friction across engineering and hardware teams by building automated CI/CD pipelines with static analysis and integration testing, enabling consistent, validated releases to embedded production targets.
- Improved cross-functional delivery by collaborating daily with hardware, firmware, and systems engineers to translate technical requirements into software specifications, managing expectations and communicating progress across a highly matrixed organization.
- Increased reliability of high-frequency data ingestion microservices by designing fault-tolerant Python and C++ service architectures on AWS, applying modular patterns that simplified future integration and maintenance.

Doxy.me

Software Engineer

Charleston, SC

August 2024 – May 2025

- Reduced manual integration overhead for clinical partners by building RESTful Python and TypeScript APIs with well-documented contracts, enabling third-party systems to onboard and interoperate with the platform reliably and without white-glove support.
 - Accelerated customer-facing feature delivery by owning end-to-end CI/CD configuration and AWS infrastructure automation, maintaining zero-downtime releases and reproducible environments across multiple production deployments.
 - Improved platform trust with clinical users by integrating WebRTC and LLM-based inference pipelines (PyTorch, Llama) into live workflows on SageMaker and Fargate, and documenting integration patterns and deployment procedures for long-term maintainability.
-

Projects

University Course Planning/Review Platform (Class Best): Built a multi-service data platform enabling student schedule matching, course overlap detection, and behavioral insights. Developed ETL pipelines in Python to process thousands of course records, user preferences, and time-series activity logs. Built a responsive frontend in React + Tailwind with interactive dashboards, heatmaps, and calendar visualizations.

Telehealth Mental Health Diagnosis Tool (Doxy.me): Built an AI system that analyzes visual, speech, and tonal cues from telehealth sessions using PyTorch and Llama, delivering structured mental health insights to treating physicians via SageMaker and Fargate inference pipelines. Improved diagnostic accuracy using reinforcement learning and WebRTC video integration.

Configuration Fuzzer: Developed a configuration fuzzing tool for OSS-Fuzz, automating build generation to identify critical compile-time configurations and improve code coverage, uncovering previously untested code paths and increasing bug detection effectiveness.
